

Press release

29 October 2015, Brussels

On the road to COP21, over 500 cities' actions shine thanks to **Energy Cities'** new best-practice database!

Energy Cities offers a brand new online best practice database. Entirely revamped and updated ahead of COP21, it highlights the vitality of European **cities' action in the field of energy and climate** policies.

More content

Energy Cities' database features 500 examples illustrating all energy transition aspects in Europe: local resources, energy efficiency, sustainable mobility, governance, social innovation, financing...

Access to content has been made easier by adding a new set of more accurate keywords, better attuned to current energy transition themes such as the circular economy or urban eco-logistics.

More images and improved ergonomics

Detailed information illustrated with beautiful visuals and fluid, instinctive browsing: all has been designed to make people want to take a local energy transition tour in Europe. Visitors can discover innovative cities, give their opinion and share their favourite examples on social media!

More meaning

Energy Cities' best practice database is now linked to our "Proposals for the energy transition of cities and towns". Their contents, both practical and theoretical, intersect and feed one another.

From the multitude of measures taken every day at local level - **where Energy Cities' members are** developing future-oriented solutions - to a shared vision of the low energy city with a high quality of life for all, Energy Cities is more than ever the European network of local authorities in energy transition.
